

Reflection:

Which types of pollution are carried by rainwater? Which are carried by stormwater?

Look at how each type of pollution moves through the model. How would you find evidence of these types of pollution in the arroyo near your school?

Point source pollution comes from a single location, like a factory, while nonpoint source pollution is from a broad area, like runoff from roads. What evidence would you look for in the arroyo to identify each type of pollution?

How would you suggest that each type of pollution is mitigated? If time allows, try to test these solutions using the model.
